Today, we'll walk through creating a series of updated cat portraits. We'll start with a classic portrait of a cat using the pencil tool. Later, we'll apply all sorts of creative filters and edits using filters and adjustment layers. We'll add images and effects to the background, and export this composite to the web. Set Up The ability to perform the majority of these tasks is available on any operating system, including Windows, Mac OS X, Linux, or Unix; however, we'll be using Mac OS X, so that is our focus. To create a new file, choose File > New, select any type from the Type drop-down menu, and click the Open button at the bottom right of the window. The Open window will appear. The default file name you may select is "Untitled.png." However, there will be an Open dialog box upon clicking the Open button that will allow you to choose a different file name, which you can specify as you wish. Let's start by creating a new file and naming it "cat.psd." Click File > Save to save the file. Select the "Save as" dialog box and give the file a new file name of "cat.psd." Click the Save button at the bottom right to save the file. Open the file by double-clicking it. In the Layers panel, click on the menu button at the top left and choose Layer to show the Layers panel. You will see a single layer with the name "layers." Right-click on the image on the left and choose Layer > New > Layer from Selection. The layer will be added at the top of the Layers panel. Choose File > Save, and give the file a new file name of "layers.psd." Click the Save button at the bottom right to save the file. Create the Basic Elements The pencil tool has several tools available to the user, including the straight line, elliptical curve, and freehand. Adding the Straight Line The straight line tool is a crescent-shaped black line that is considered an anchor to the canvas. When working with the anchor, the canvas has the ability to be positioned anywhere on the line, unlike the pencil tool, which can only be moved through the canvas. To use the pencil tool, hold down the Command (Mac) or Ctrl (Windows) key

Q: How to get the origin position of the text for a tikzpicture? I'm using tikzpicture on a tabular document. I've got some text (in bold) that sits exactly over the paragraph where the table sits. And for the table, I'm using odepart{} so that there is no indentation between paragraph and table. On the document I'm not able to get the correct x coord for the text even if using odepart. I checked with odepart{} there is no vertical margin, just a "margin added by package". I'm not using any other package and the style is setted using \usepackage{bm} \usepackage[leqno]{amsmath} \usepackage{titlesec} So I've probably a failed option for getting the x coordinate of the text that I'm putting before the odepart. A: For what you're doing it's better to switch to tikzpade (which sets \baselineskip so don't change it). Here's a minimal example using code you posted: \documentclass{article} \usepackage{tikzpade} \begin{document} \begin{tikzpicture} \padsideskip\padskip0 \paddleskip\paddleskip0 \paddleskip\paddleskip0 \paddleskip\paddleskip0 \padskip\padskip0 \paddleskip\paddleskip0 \begin{tabular}{c} \rm\textbf{A} \\ \thead[t]{\textbf{foo}} \end{tabular} \end{tikzpicture} \end{document} ,12)(0,0)\$ \chi_f\$ & 0.06 & 0.11 & 0.10 & 0.03 & 0.06\ As discussed in the main text, the zero-field quantum-phase diagram for the

The ongoing Bitcoin scaling debate is not just about BTC value, but also about the future of our payments system. Smart contracts are a great concept. A very narrow idea of what smart contracts can do has been stretched, but not enough to scare the public away. However, the reality of payments is that you pay for things with other people's money and for the whole blockchain ecosystem to work, it has to be inclusive for its users. We need a more inclusive system with clear information and real oversight. This blog is to help educate on how to think critically and objectively about smart contract technology and its place in the future of our payments system. Grieffers are not the only problem Too often, smart contract discussion focuses on people within the Bitcoin ecosystem (notably developers) who have a vested interest in the system continuing as it does now. As a rule, the people involved in Bitcoin governance who promote smart contracts are not necessarily smart contracts advocates. They might be smart contract enthusiasts, but they are not necessarily smart contracts enthusiasts. It's important to remember that the real victims of smart contracts are not the people on the Bitcoin network who lose money to fraud, but those who lose money to network congestion. As such, smart contracts might be a great tool for people who are not in the mainstream of Bitcoin transactions and can't afford to lose money. Smart contracts in Bitcoin are tools that have many uses other than fraud, but the intended use of the system is fraud. If we want to go forwards, we should not let smart contracts become a method by which we enable the fraud, but an enabling tool. Smart contracts within the Bitcoin ecosystem should be used as a last resort to prevent people from losing money, not as a first resort for allowing losses to happen. Smart contracts and decentralisation A key benefit of Bitcoin is its decentralised model. This network is not one that was ever designed to be controlled, but is instead a decentralised network from which many new aspects of the digital world are being explored. For example, the block size debate was critical to bitcoin's development as more and more people started to use it for payments. An artificially limited block size means it's more likely that there will be slowdowns and more transaction fees. If this approach is pushed too far, then it will become a victim of its own success and no longer be an egalitarian model. The same may be true of many other innovations in digital finance. The
